We test physiochemical, microstructural and identification properties. We perform tests of:

- cementitious materials, lime and gypsum

- additions to concrete (fly ashes, silica dusts, blast furnace slags, etc.)
- concrete admixtures
- mortars, adhesives and plastering mixes
- mineral aggregates
- steel and polymer fibres
- stone materials and products
- regular and lightweight concrete
- tests of concrete mixtures, concrete products and concrete in structures
- non-destructive field evaluation of concrete in structures
- testing of technical parameters of concrete collected from structures (boreholes)
- examination of water penetration depth under pressure, water resistances, resistance to frost, diffusion of chlorides
- parameters of concrete mixtures: density, consistence class, total air content, temperature
- effectiveness of hydrophobic agents
- rheological properties of cement pastes.
